Natija: 1 / 5 (20%)

1. Which scientists are credited with founding cell theory in 1838-1839?

- (*) B: Teodor Schwann and Matthias Schleiden
[!] C: Rudolf Virchow and Louis Pasteur
D: Charles Darwin and Alfred Russel Wallace

Izoh: The cell theory was formally articulated by Teodor Schwann and Matthias Schleiden in 1838-1839, establishing that all living organisms are composed of cells.

2. What did Rudolf Virchow state in 1858 regarding the origin of cells?

- B: All cells are produced by a single primordial cell
C: Cells develop spontaneously from nonliving matter
[!] D: Cell division occurs only in multicellular organisms

Izoh: Virchows dictum 'Omnis cellula e cellula' (every cell comes from another cell) highlighted the continuity of cellular life and the necessity of cell division.

3. Which model best describes the plasma membranes composition and behavior?

- B: Solid lipid lattice
[!] C: Rigid protein scaffold
D: Layered phospholipid monolayer

Izoh: The membrane is composed of a bilayer of phospholipids with embedded proteins that move laterally, constituting the fluidmosaic model.

4. During the metaphase stage of mitosis, what characteristic event takes place?

- B: Chromatids separate toward opposite poles
[!] C: The nuclear envelope dissolves
D: DNA replication occurs

Izoh: Metaphase is the stage when duplicated chromosomes line up at the cells equator, facilitating accurate segregation in the subsequent anaphase.

5. Which organelle possesses its own DNA and ribosomes, allowing it to function semiautonomously?

A:

B: Endoplasmic reticulum

[X] C: Mitochondrion

D: Golgi apparatus

Izoh: Mitochondria contain circular DNA and ribosomes, enabling them to synthesize some of their own proteins independently of the cytoplasmic machinery.
